---

1. MLflow Experiment Runs

The following three Random Forest runs were compared under the **delivery-time** experiment in MLflow:

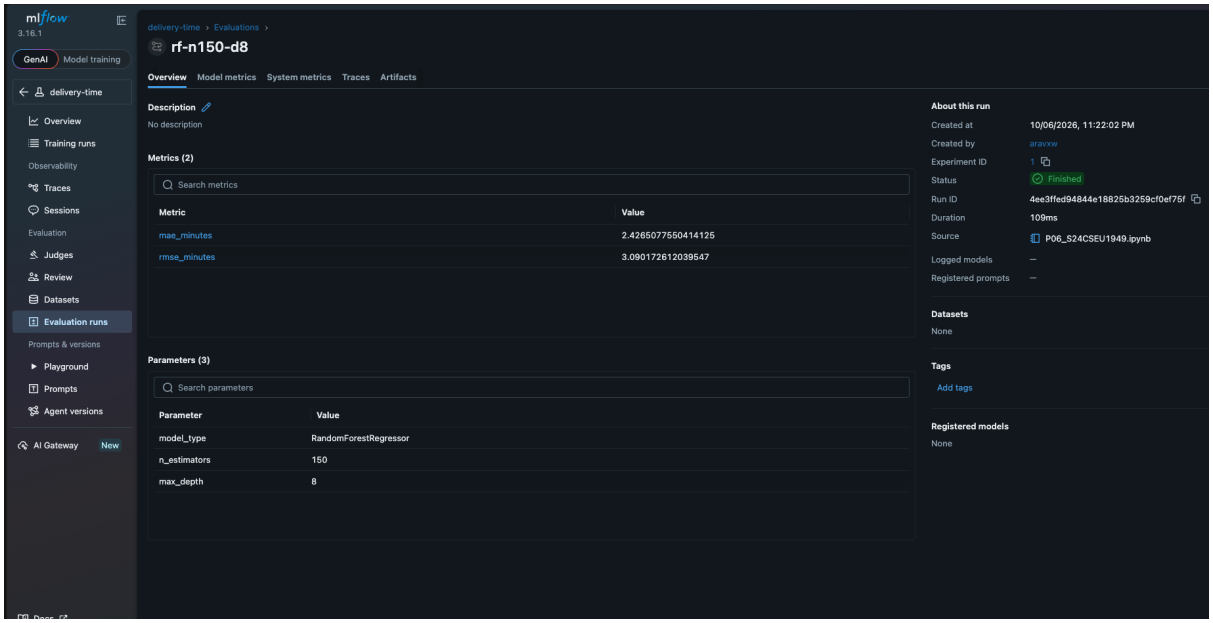

- `rf-n50-d4`
- `rf-n100-d6`
- `rf-n150-d8`

---

2. Selected Best Run

The best-performing run was selected based on the **Mean Absolute Error (MAE)**, where a lower value indicates better prediction performance.

---

3. Best Run Details

Run Name: `rf-n150-d8`

Run ID: `4ee3ffed94844e18825b3259cf0ef75f`

Model Type: `RandomForestRegressor`

Parameters:

- `n_estimators = 150`
- `max_depth = 8`

Metrics:

- `mae_minutes = 2.4265077550414125`
- `rmse_minutes = 3.090172612039547`

Reason for Selection:
I selected this run because it achieved the lowest MAE among the three compared Random Forest runs, indicating the smallest average absolute prediction error.
